

Dynamical coupled-channels approach to light-flavor baryon spectroscopy

Hiroiyuki Kamano

Research Center for Nuclear Physics (RCNP)

Osaka University

Outline

- 1. Background and motivation for N^* spectroscopy**
- 2. Results of ANL-Osaka Dynamical Coupled-Channels (DCC) analysis of πN and γN reactions**
 - Brief description of ANL-Osaka DCC model
 - Results of 6-channel DCC analysis (2006-2009)
 - Results of 8-channel DCC analysis (2010-2012) → [arXiv: 1305.4351](https://arxiv.org/abs/1305.4351)
- 3. Ongoing projects and future plans with ANL-Osaka DCC approach**
- 4. Summary**

Light-flavor baryon spectroscopy : Physics of broad & overlapping resonances

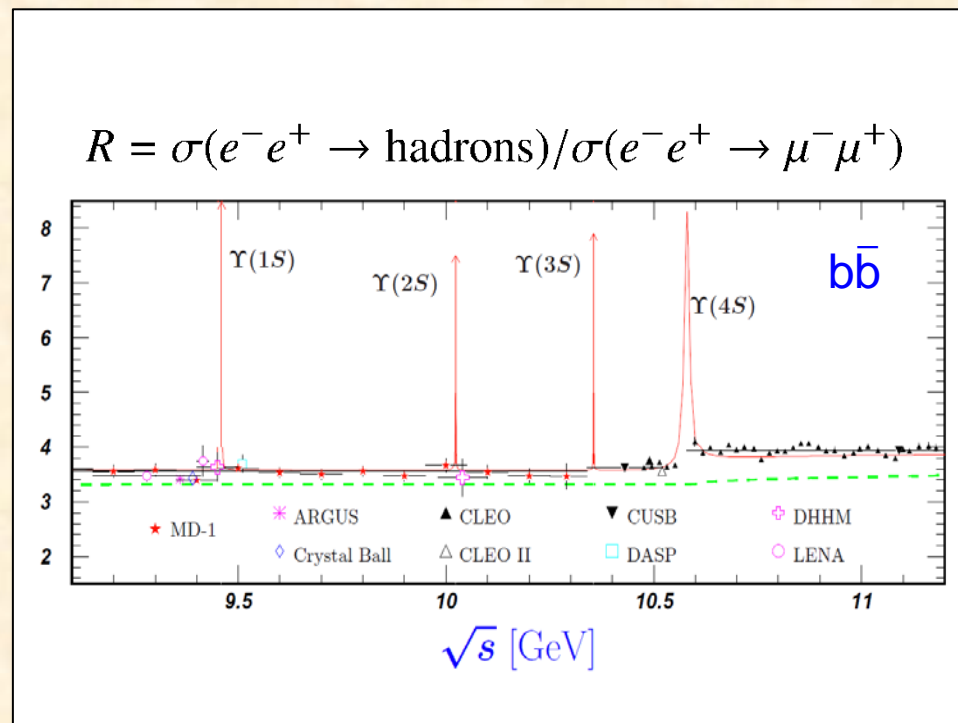

- ✓ Width: a few hundred MeV.
[(width/mass) ~ 0.1 - 0.2]
- ✓ Resonances are highly overlapping
in energy except $\Delta(1232)$.

$$R = \sigma(e^-e^+ \rightarrow \text{hadrons})/\sigma(e^-e^+ \rightarrow \mu^-\mu^+)$$

- ✓ Width: ~10 keV to ~10 MeV
[(width/mass) ~ 10^{-3} - 10^{-4}]
- ✓ Each resonance peak is clearly separated.

Light-flavor baryon spectroscopy : Physics of broad & overlapping resonances

- ✓ Width: a few hundred MeV.
[(width/mass) ~ 0.1 - 0.2]
- ✓ Resonances are highly overlapping
in energy except $\Delta(1232)$.

- ✓ Width: ~10 keV to ~10 MeV
[(width/mass) ~ 10^{-3} - 10^{-4}]
- ✓ Each resonance peak is clearly separated.

All of these studies essentially agree on the existence and (most) properties of the 4-star states. For the 3-star and lower states, however, even a statement of existence is problematic.

— Arndt, Briscoe, Strakovsky, Workman PRC 74 045205 (2006)

— Arndt, Briscoe, Strakovsky, Workman PRC 74 045205 (2006)

Most of the N*s were determined from

$$\pi N \rightarrow \pi N, \quad \gamma N \rightarrow \pi N$$

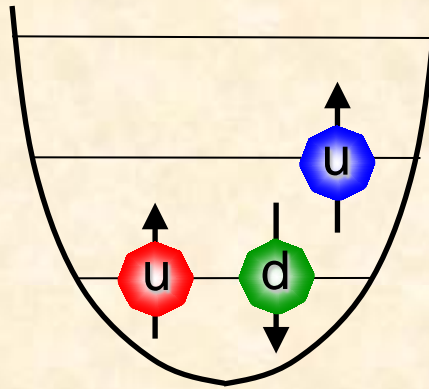

Need **comprehensive analysis** of

$$\pi N, \eta N, \pi\pi N, KY, \omega N, \dots$$

channels !!

Hadron spectrum and reaction dynamics

- ✓ Various **static hadron models** have been proposed to calculate hadron spectrum and form factors.
 - Quark models, Bag models, Dyson-Schwinger approaches, Holographic QCD,...
 - **Excited hadrons** are treated as **stable particles**. → The resulting masses are **real**.

Constituent quark model

Hadron spectrum and reaction dynamics

- ✓ Various **static hadron models** have been proposed to calculate hadron spectrum and form factors.
 - Quark models, Bag models, Dyson-Schwinger approaches, Holographic QCD,...
 - **Excited hadrons** are treated as **stable particles**. → The resulting masses are **real**.
- ✓ In reality, excited hadrons are **“unstable”** and can exist **only as resonance states** in hadron reactions.

“Mass” becomes **complex** !!
→ **“pole mass”**

“molecule-like” states

core (bare state) + meson cloud

Hadron spectrum and reaction dynamics

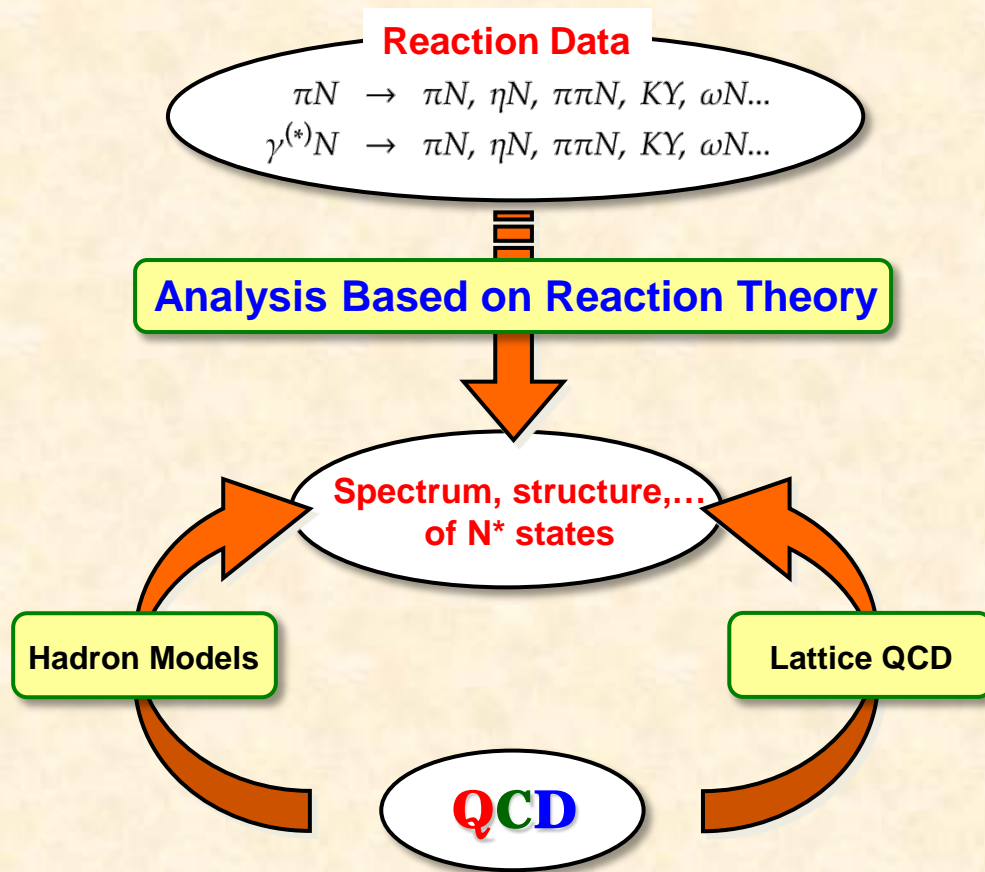

- ✓ Various **static hadron models** have been proposed to calculate hadron spectrum and form factors.

 - **Excited hadrons** are treated as **stable particles**. → The resulting masses are **real**.
- ✓ In reality, excited hadrons are **“unstable”** and can exist **only as resonance states** in hadron reactions.

“Mass” becomes **complex** !!
→ **“pole mass”**

What is the role of **reaction dynamics** in interpreting the hadron spectrum, structures, and dynamical origins ??

N^* spectroscopy with ANL-Osaka Dynamical Coupled-Channels (DCC) approach

Objectives and goals:

Through the **comprehensive analysis** of world data of πN , γN , $N(e,e')$ reactions,

- ✓ Determine N^* spectrum (**pole masses**)
- ✓ Extract N^* form factors (e.g., N - N^* e.m. transition form factors)
- ✓ Provide **reaction mechanism information** necessary for interpreting N^* spectrum, structures and dynamical origins

N^* spectroscopy with ANL-Osaka Dynamical Coupled-Channels (DCC) approach

Reaction Data

$\pi N \rightarrow \pi N, \eta N, \pi\pi N, KY, \omega N...$
 $\gamma^{(*)} N \rightarrow \pi N, \eta N, \pi\pi N, KY, \omega N...$

Analysis Based on Reaction Theory

“Dynamical coupled-channels model of meson production reactions”

A. Matsuyama, T. Sato, T.-S.H. Lee Phys. Rep. 439 (2007) 193

QCD

Objectives and goals:

Through the **comprehensive analysis** of world data of $\pi N, \gamma N, N(e, e')$ reactions,

- ✓ Determine N^* spectrum (**pole masses**)
- ✓ Extract N^* form factors

structures and dynamical origins

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

- ✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

$$T_{a,b}^{(LSJ)}(p_a, p_b; E) = V_{a,b}^{(LSJ)}(p_a, p_b; E) + \underbrace{\sum_c \int_0^\infty q^2 dq V_{a,c}^{(LSJ)}(p_a, q; E) G_c(q; E) T_{c,b}^{(LSJ)}(q, p_b; E)}_{\text{coupled-channels effect}}$$

- ✓ Reaction channels:

$$a, b, c = (\gamma^{(*)}N, \pi N, \eta N, \pi\Delta, \sigma N, \rho N, K\Lambda, K\Sigma, \omega N \dots)$$

$\pi\pi N$

- ✓ Transition Potentials:

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials
 Z-diagrams
 bare N^* states

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

$$T_{a,b}^{(LSJ)}(p_a, p_b; E) = V_{a,b}^{(LSJ)}(p_a, p_b; E) + \underbrace{\sum_c \int_0^\infty q^2 dq V_{a,c}^{(LSJ)}(p_a, q; E) G_c(q; E) T_{c,b}^{(LSJ)}(q, p_b; E)}_{\text{coupled-channels effect}}$$

✓ Meson-Baryon Green functions G_{MB}

$MB = \pi N, \eta N, K\Lambda, K\Sigma, \omega N$

Stable channels

$MB = \pi\Delta, \rho N, \sigma N$

Quasi 2-body channels

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

$$T_{a,b}^{(LSJ)}(p_a, p_b; E) = V_{a,b}^{(LSJ)}(p_a, p_b; E) + \underbrace{\sum_c \int_0^\infty q^2 dq V_{a,c}^{(LSJ)}(p_a, q; E) G_c(q; E) T_{c,b}^{(LSJ)}(q, p_b; E)}_{\text{coupled-channels effect}}$$

✓ Reaction channels:

$$a, b, c = (\gamma^{(*)}N, \pi N, \eta N, \pi\Delta, \sigma N, \rho N, K\Lambda, K\Sigma, \omega N \dots)$$

$\pi\pi N$

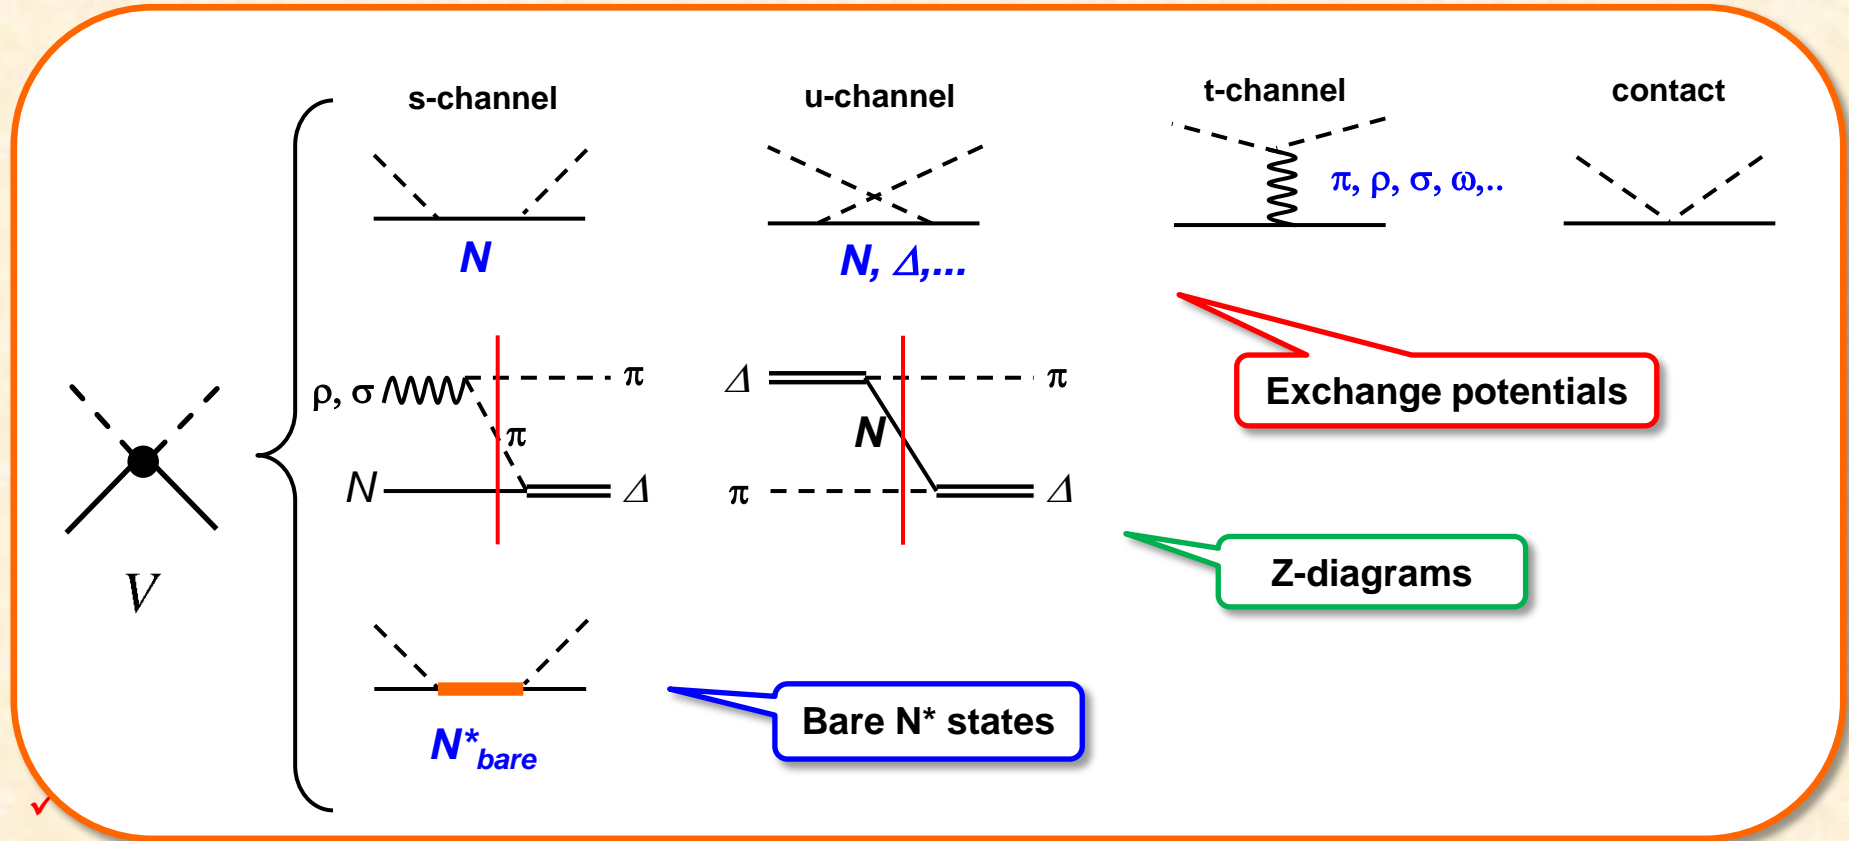

✓ Transition Potentials:

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials Z-diagrams bare N^* states

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials
 Z-diagrams
 bare N* states

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

- ✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

$$T_{a,b}^{(LSJ)}(p_a, p_b; E) = V_{a,b}^{(LSJ)}(p_a, p_b; E) + \underbrace{\sum_c \int_0^\infty q^2 dq V_{a,c}^{(LSJ)}(p_a, q; E) G_c(q; E) T_{c,b}^{(LSJ)}(q, p_b; E)}_{\text{coupled-channels effect}}$$

- ✓ Reaction channels:

$$a, b, c = (\gamma^{(*)}$$

Would be possible to relate with hadron states of the **static hadron models** (quark models, DSE, etc.) **excluding meson-baryon continuums.**

- ✓ Transition Potentials:

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials Z-diagrams bare N^* states

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

$$T_{a,b}^{(LSJ)}(p_a, p_b; E) = V_{a,b}^{(LSJ)}(p_a, p_b; E) + \underbrace{\sum_c \int_0^\infty q^2 dq V_{a,c}^{(LSJ)}(p_a, q; E) G_c(q; E) T_{c,b}^{(LSJ)}(q, p_b; E)}_{\text{coupled-channels effect}}$$

✓ Reaction channels:

$$a, b, c = (\gamma^{(*)}N, \pi N, \eta N, \pi\Delta, \sigma N, \rho N, K\Lambda, K\Sigma, \omega N \dots)$$

$\pi\pi N$

✓ Transition Potentials:

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials
 Z-diagrams
 bare N^* states

Dynamical coupled-channels (DCC) model for meson production reactions

For details see Matsuyama, Sato, Lee, Phys. Rep. 439,193 (2007)

- ✓ Partial wave (LSJ) amplitudes of $a \rightarrow b$ reaction:

Physical N^* s will be a “mixture” of the two pictures:

$$|N^*\rangle = |MB\rangle$$

$$|N^*\rangle = |qqq\rangle + |\text{m.c.}\rangle$$

- ✓ Transition Potentials:

$$V_{a,b} = v_{a,b} + Z_{a,b} + \sum_{N^*} \frac{\Gamma_{N^*,a}^\dagger \Gamma_{N^*,b}}{E - M_{N^*}}$$

Exchange potentials
 Z-diagrams
 bare N^* states

DCC analysis (2006-2009)

γN , πN , ηN , $\pi\Delta$, ρN , σN coupled-channels calculations were performed.

Hadronic part

- ✓ $\pi N \rightarrow \pi N$: Analyzed to construct a hadronic part of the model **up to $W = 2$ GeV**
Julia-Diaz, Lee, Matsuyama, Sato, PRC76 065201 (2007)
- ✓ $\pi N \rightarrow \eta N$: Analyzed to construct a hadronic part of the model **up to $W = 2$ GeV**
Durand, Julia-Diaz, Lee, Saghai, Sato, PRC78 025204 (2008)
- ✓ $\pi N \rightarrow \pi\pi N$: Fully dynamical coupled-channels calculation **up to $W = 2$ GeV**
Kamano, Julia-Diaz, Lee, Matsuyama, Sato, PRC79 025206 (2009)

Electromagnetic part

- ✓ $\gamma^{(*)} N \rightarrow \pi N$: Analyzed to construct a E.M. part of the model **up to $W = 1.6$ GeV and $Q^2 = 1.5$ GeV²**
(photoproduction) Julia-Diaz, Lee, Matsuyama, Sato, Smith, PRC77 045205 (2008)
(electroproduction) Julia-Diaz, Kamano, Lee, Matsuyama, Sato, Suzuki, PRC80 025207 (2009)
- ✓ $\gamma N \rightarrow \pi\pi N$: Fully dynamical coupled-channels calculation **up to $W = 1.5$ GeV**
Kamano, Julia-Diaz, Lee, Matsuyama, Sato, PRC80 065203 (2009)

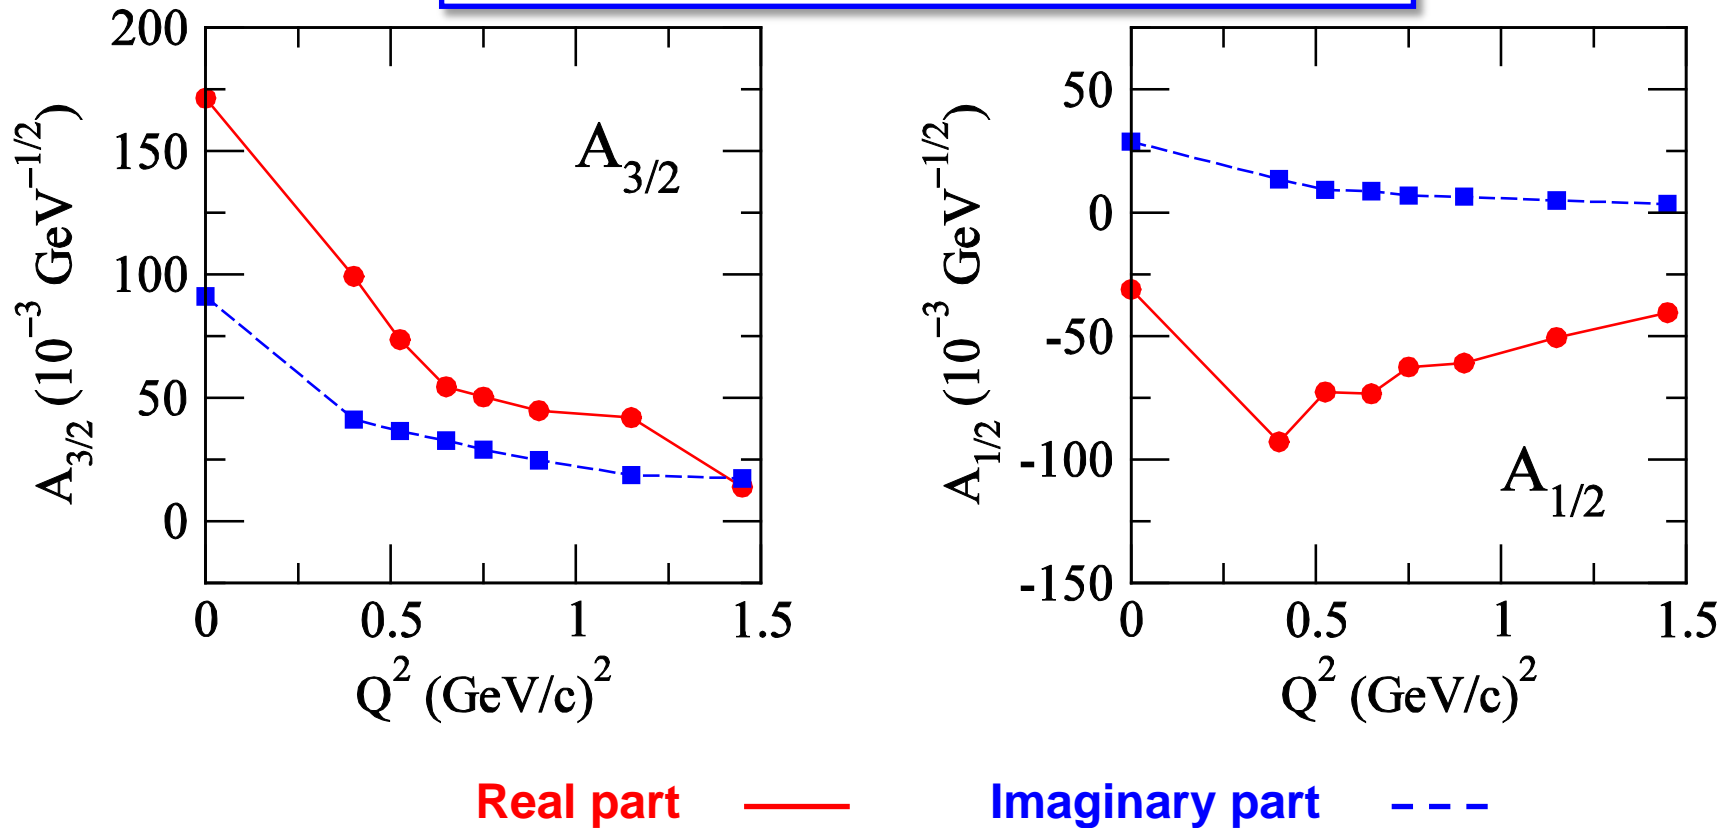

Extraction of N^* parameters

- ✓ Extraction of N^* pole positions & new interpretation on the dynamical origin of P11 resonances
Suzuki, Julia-Diaz, Kamano, Lee, Matsuyama, Sato, PRL104 065203 (2010)
- ✓ Stability and model dependence of P11 resonance poles extracted from $\pi N \rightarrow \pi N$ data
Kamano, Nakamura, Lee, Sato, PRC81 065207 (2010)
- ✓ Extraction of $\gamma N \rightarrow N^*$ electromagnetic transition form factors
Suzuki, Sato, Lee, PRC79 025205 (2009); PRC82 045206 (2010)

Consequences of reaction dynamics (1/3): Complex nature of resonance parameters

Extracted from analyzing the $p(e,e'\pi)N$ data ($\sim 20,000$) from CLAS

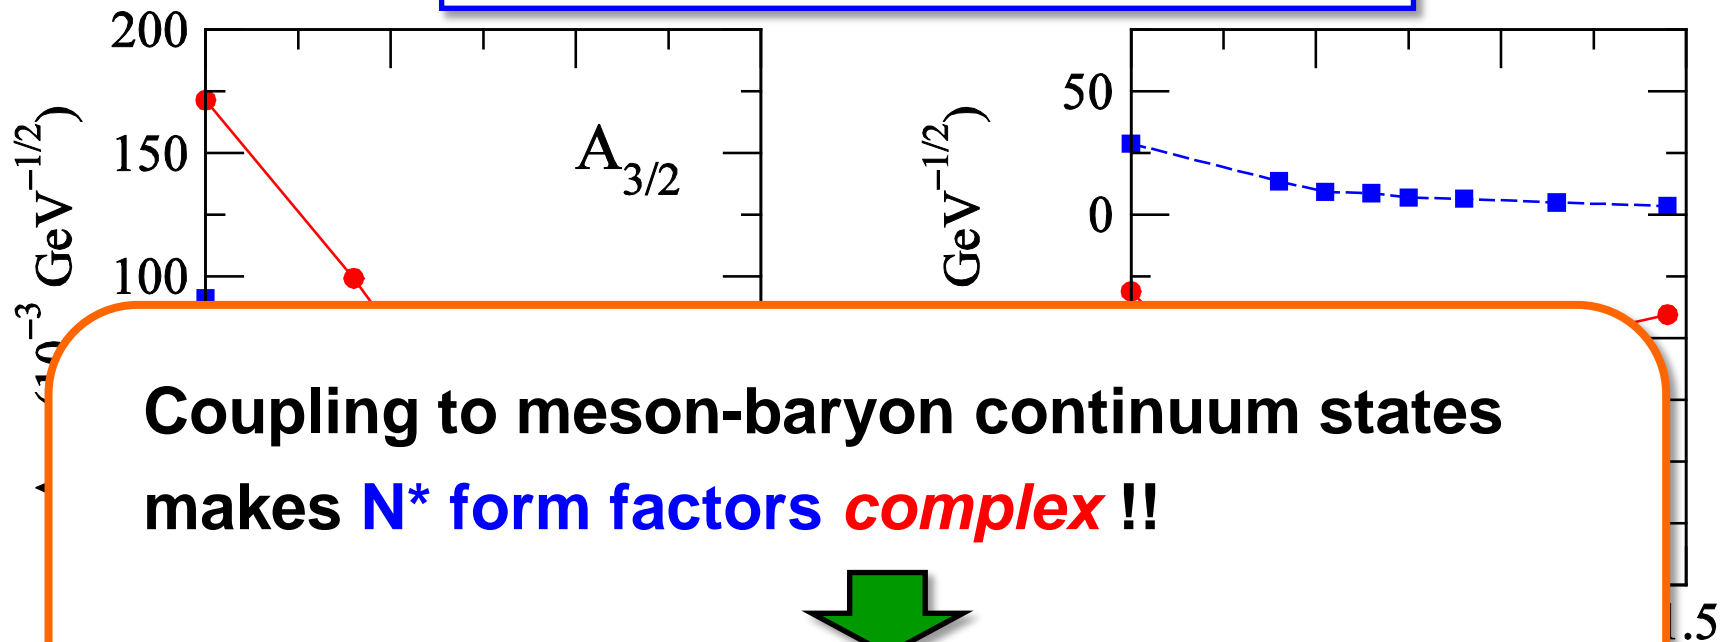

Nucleon - 1st D13 e.m. transition form factors

Consequences of reaction dynamics (1/3): Complex nature of resonance parameters

Extracted from analyzing the $p(e,e'\pi)N$ data ($\sim 20,000$) from CLAS

Nucleon - 1st D13 e.m. transition form factors

Coupling to meson-baryon continuum states
makes N^* form factors *complex* !!

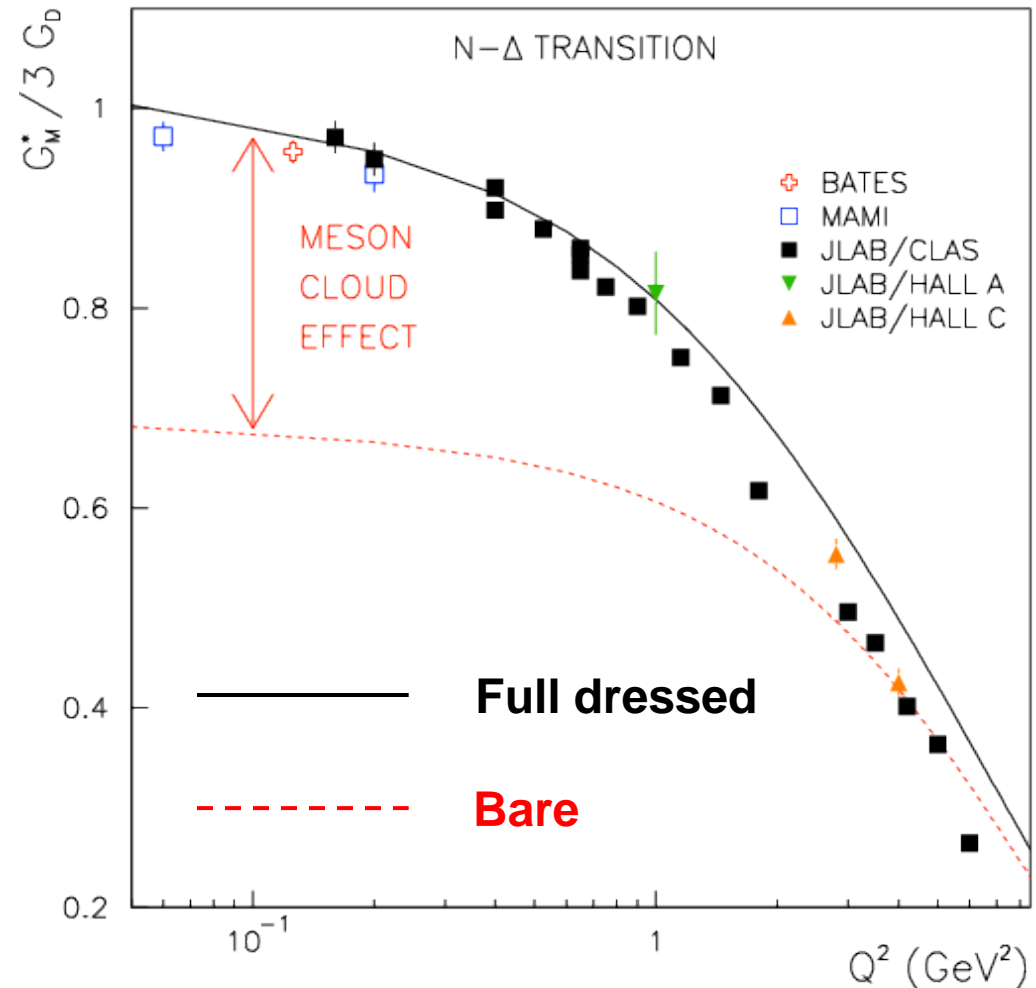

Fundamental nature of **resonant particles**
(decaying states)

Consequences of reaction dynamics (2/3): Meson cloud effect

N-N* e.m. transition form factor

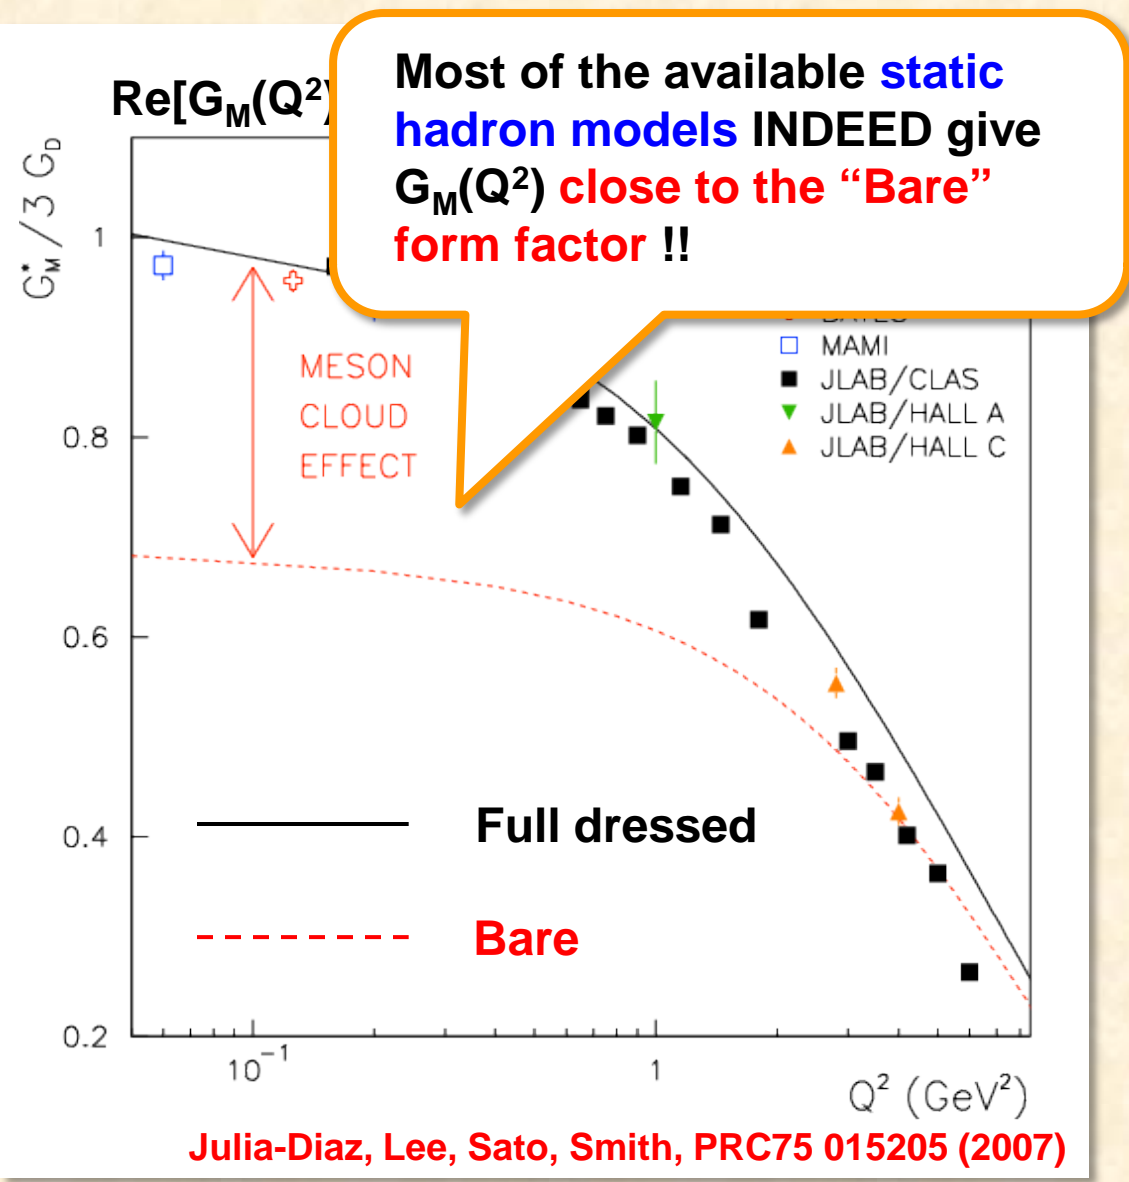

Re[G_M(Q²)] for $\gamma N \rightarrow \Delta(1232)$ transition

Julia-Diaz, Lee, Sato, Smith, PRC75 015205 (2007)

Consequences of reaction dynamics (2/3): Meson cloud effect

N-N* e.m. transition form factor

Consequences of reaction dynamics (2/3): Meson cloud effect

N-N* e.m. transition form factor

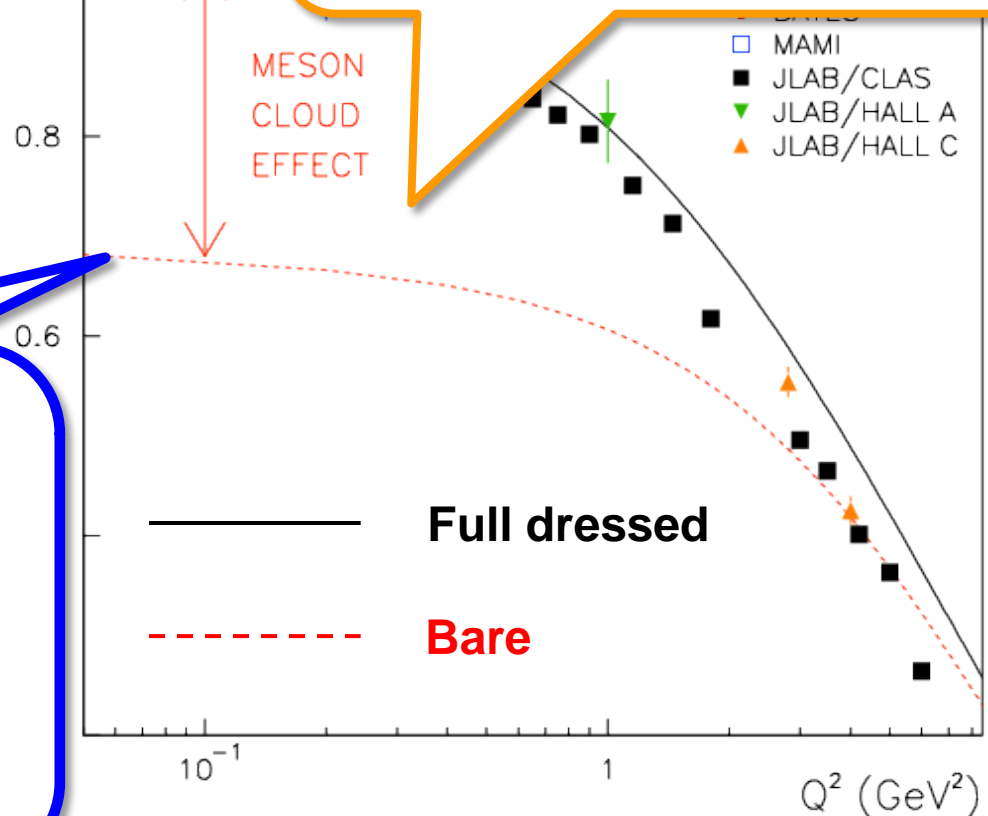

meson cloud

core (bare)

$\text{Re}[G_M(Q^2)]$

$G_M^*/3 G_D$

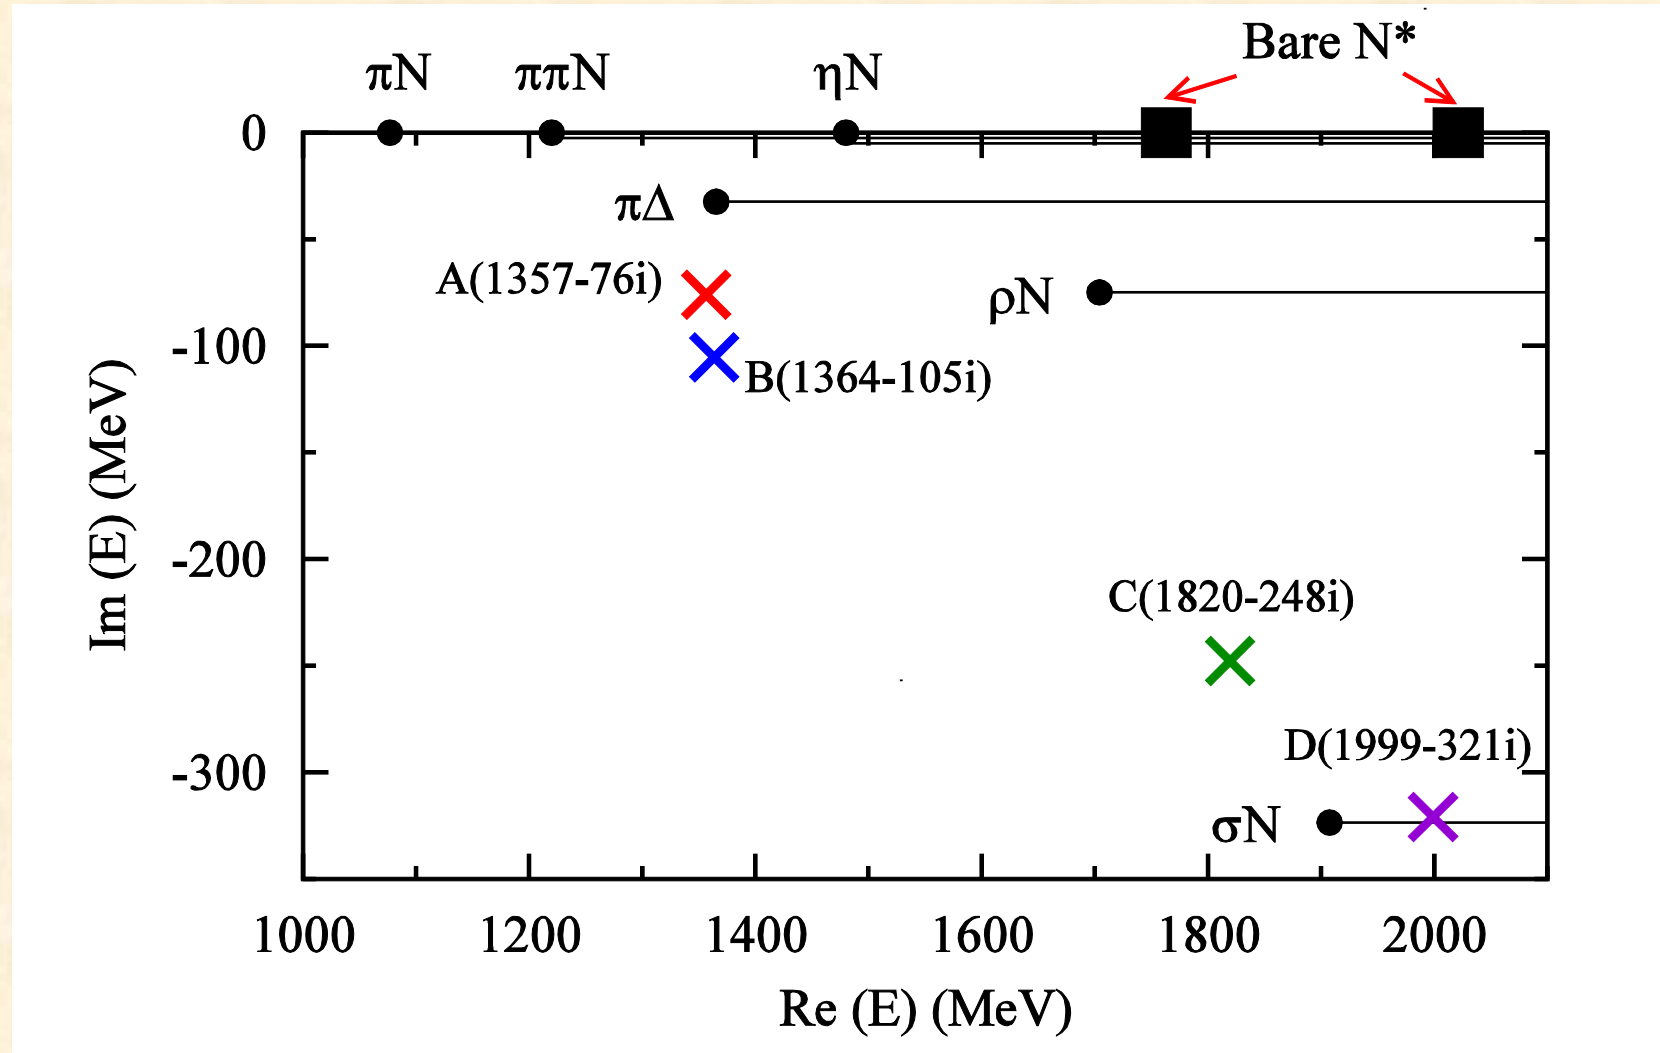

Most of the available static hadron models INDEED give $G_M(Q^2)$ close to the "Bare" form factor !!

Consequences of reaction dynamics (3/3): Dynamical origin of nucleon resonances

Suzuki, Julia-Diaz, Kamano, Lee, Matsuyama, Sato, PRL104 065203 (2010)

(Complex) pole masses and dynamical origin of $l=1/2$, $J^P = 1/2^+$ resonances

Consequences of reaction dynamics (3/3): Dynamical origin of nucleon resonances

Suzuki, Julia-Diaz, Kamano, Lee, Matsuyama, Sato, PRL104 065203 (2010)

(Complex) pole masses and dynamical origin of $l=1/2$, $J^P = 1/2^+$ resonances

Multi-channel reactions can generate **many** resonance poles from a **single** bare state !!

Eden, Taylor, Phys. Rev. 133 B1575 (1964)

For evidences in hadron and nuclear physics, see e.g., in Morgan and Pennington, PRL59 2818 (1987)

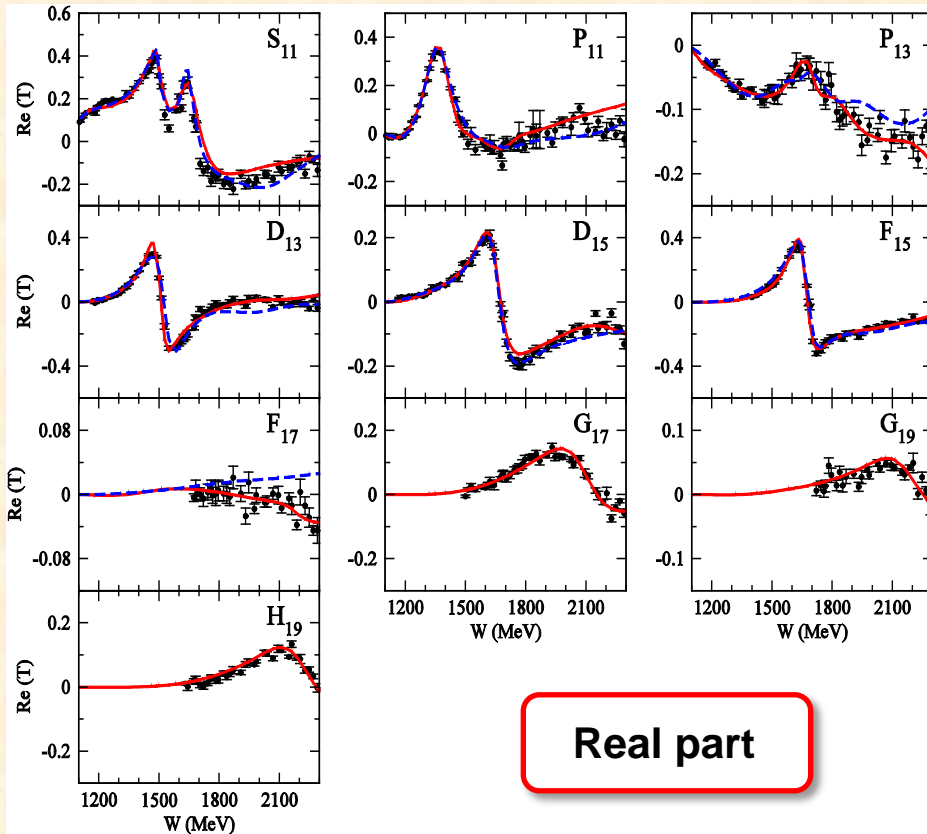

ANL-Osaka DCC analysis

Fully combined analysis of πN , $\gamma N \rightarrow \pi N$, ηN , $K\Lambda$, $K\Sigma$ reactions !!
(more than **22,000** data of unpolarized & polarized observables to fit)

Summary

- ✓ Performed a fully combined analysis of **pion-** and **photon-**induced **πN , ηN , $K\Lambda$, $K\Sigma$** production reactions with the ANL-Osaka Dynamical Coupled-Channels approach.
- ✓ Revealed the role of **nontrivial multichannel reaction dynamics** in understanding the nature of N^* resonances.
- ✓ The extracted N^* parameters (pole masses, residues,...) are compared with other multi-channel analyses:
 - Extracted resonance masses **agree well for almost all the 1st excited states** in each partial wave, while **sizable differences are found for several higher excited states**.
 - Compared with pole masses, **residues (“coupling constants”) are more sensitive to the analysis performed**.
- ✓ Further applications and extensions of the ANL-Osaka DCC model are in progress.
- ✓ N^* spectroscopy is an ideal laboratory for studying “resonance”, a universal phenomena over a wide range of areas of physics !!

e.g.) **YITP workshop on “Resonances and non-Hermitian systems in quantum mechanics” (Dec., 2012)**

Conventions for coupling constants

- ✓ $\alpha \rightarrow \beta$ reaction amplitude at resonance pole position M_R is expressed as

$$\mathcal{F}_{\beta,\alpha}(W \rightarrow M_R) = -\frac{R_{\beta,\alpha}}{W - M_R} + \dots$$

- ✓ The residue is then interpreted as the product of “coupling constants” of $N^*-\beta$ and $N^*-\alpha$:

$$R_{\beta,\alpha} \equiv g_{\beta,N^*} \times g_{\alpha,N^*}.$$

- ✓ If one tries to get the coupling constants from the residues, the constants can be determined up to a sign. We fix the sign ambiguity by choosing the phase of the πN scattering residue as

$$-\pi < \arg[R_{\pi N,\pi N}] < \pi.$$

This corresponds to taking the real part of πNN^* coupling constants always positive: $\text{Re}(g_{N^*,\pi N}) > 0$.

With this convention, the relative signs of all coupling constants are uniquely fixed.

Phenomenological prescriptions of constructing conserved-current matrix elements

As commonly done in *practical* calculations in nuclear and particle physics, currently we take a phenomenological prescription to construct conserved current matrix elements [T. Sato, T.-S. H. Lee, PRC60 055201 (2001)]:

$$J^\mu \rightarrow J^\mu - \frac{q \cdot J}{n \cdot q} n^\mu$$

J^μ : Full e.m. current matrix elements obtained by solving DCC equations

q^μ : photon momentum n^μ : an arbitrary four vector

- ✓ A similar prescription is applied, e.g., in Kamalov and Yang, PRL83, 4494 (1999).
- ✓ There are also other prescriptions that enable **practical calculations** satisfying **current conservation or WT identity**:
 - Gross and Riska, PRC36, 1928 (1987)
 - Ohta, PRC40, 1335 (1989)
 - Habermatzl, Nakayama, and Krewald, PRC74, 045202 (2006).

$\pi^- p \rightarrow \eta n$ reaction

DCS

NOTE:

It is known that there is an inconsistency on the normalization of the $\pi^- p \rightarrow \eta n$ data between different experiments.

The data used in our analysis are carefully selected according to the discussion by Durand et al. PRC78 025204.
